

Vaping: Parent factsheet

Vaping is the inhaling of an aerosol (mist) created by an electronic cigarette (e-cigarette). It's common among teens.

By learning about vaping, parents can:

- Talk to their kids about its health risks.
- Recognize if their child might be vaping.
- Get help for kids who are vaping.

What is vaping?

E-cigarettes (often called vape pens) are battery-operated vaping devices that heat a liquid until it becomes an aerosol (mist), which is inhaled. The aerosol is not just water vapor. It usually contains nicotine, other harmful chemicals, and flavourings. Even e-cigarettes that claim to have no nicotine have been found to contain nicotine. Some might contain [marijuana](#), herbs, or oils.

Some e-cigarettes are disposable and designed for one-time use. When the liquid is used up or the battery dies, the user throws the device away. Others can be refilled with liquid, recharged, and used over and over. Some people buy pre-filled cartridges for the e-cigarette. Others buy a bottle of liquid and refill the e-cigarette as needed.

What Are the Health Risks of Vaping?

The health risks of vaping include:

- **addiction:** E-cigarettes contain [nicotine](#), a drug that's highly addictive. You don't have to vape every day to get addicted.
- **anxiety** and **depression:** Nicotine makes [anxiety](#) and [depression](#) worse. It also affects memory, concentration, self-control, and attention, especially in developing brains.

- **becoming a smoker:** Young people who vape are more likely to start smoking regular (tobacco) **cigarettes** and may be more likely to develop other addictions in the future.
- **impotence:** There is some evidence that vaping can cause sexual dysfunction in men.
- **sleep problems**
- **exposure to cancer-causing chemicals**
- **chronic bronchitis**
- **lung damage** that can be life-threatening

Other health effects are possible that we don't yet know about. Vaping hasn't been around that long, so its health risks aren't all known.

How Do I Know if My Child Is Vaping?

Start by asking your child in a non-judgmental, concerned way if they have tried vaping. You want to encourage conversation, not shut it down. Even if you don't think your kids vape, talk about it with them anyway so they know it's unhealthy.

Signs of vaping include:

- new health issues such as coughing or wheezing
- e-cigarette supplies, like cartridges or other suspicious looking items
- new smells (some flavored e-cigarettes have been banned, but many remain on the market – so parents might notice fruity or sweet scents)

What Should I Do if My Child Vapes?

Your child will need your help and support to quit. Help them find the motivation to stop vaping. You might want to talk about:

- wanting to be the best, healthiest version of themselves
- not wanting to be addicted
- avoiding health effects including impotence and decreased sports performance
- not wanting to increase anxiety or depression
- saving money

- going against advertising that targets young people

Some people use vaping to curb their appetite, but there is no proof that vaping helps with weight loss. If you think therefore your child vapes, talk to them about healthier ways to stay at a healthy weight or lose weight.

How I support my child to quit vaping?

For those who want to quit, it can help to:

- Decide why they want to quit and write it down or put it in their phone. They can look at the reason(s) when they feel the urge to vape.
- Pick a day to stop vaping. They can put it on the calendar and tell supportive friends and family that they're quitting on that day.
- Chew sugar-free gum or suck on lollipops to help distract them from cravings.
- Get rid of all vaping supplies.
- Download tools (such as apps and texting programs) to their phone that can help with cravings and give encouragement while they're trying to stop vaping. Truth Initiative's [This Is Quitting](#) texting program, for example, can help young people quit vaping. [Smokefree.gov](#) also offers free apps and other tools that can help someone trying to quit smoking or vaping.
- Understand withdrawal. Nicotine addiction leads to very strong cravings for nicotine, especially in the first few days after stopping. It also can lead to headaches; feeling tired, cranky, angry, or depressed; trouble concentrating or sleeping; hunger; and restlessness. These problems get better over the following days and weeks.

What Else Should I Know?

Lend your support as your child [tries to quit](#). Set a good example by taking care of your own health. Make your house smoke-free and vape-free. If you smoke or vape, make the commitment to quit. Keep all vaping supplies and refill materials in child-resistant packaging out of the reach of children. Nicotine can poison and even kill a child

What else can I do to support my child?

Deptford
Green

If you inform Deptford Green School if your child is addicted to vaping, we can offer support. We can deliver interventions in school or we can work with external agencies to offer you and your child support. Your child would not be punished for this, they would be offered support. Please contact the Safeguarding Team or your child's tutor, Head of Year or Pastoral Leader if you require any support.
